

# SMARTALLY™ MOISTURE EDITION

## CHARGE TRACKING AND REPORTING SYSTEM

SmartTally™ Moisture Edition is a database driven analysis and reporting package. It provides a feedback loop showing you the moisture content of the wood after a specified number of hours of drying. This feedback loop allows you to tune the kiln settings to produce a consistent moisture content every time.

Hot wood must cool in the yard before going into the planer. If it doesn't, it is falsely read as wet and it bends excessively during MSR testing producing a grade lower than it actually is. The result is lost profits.

SmartTally™ ME works by collecting the necessary information so that you can attain a consistent moisture content and MSR measurement so that your product is graded as high as possible.

- Database Driven
- Windows graphical user interface.
- Customizable Reports
- Data Entry Screen
- Multiple users and access levels

Customizable Reports give you the ability to track each charge and view the date it went into the kiln, its hours dried, the Kiln moisture content and the date it went into the planer.

Piece information like Standard Deviation, Percent OK, Too Wet and Too Dry give you valuable information allowing you to fine tune your kilns to run more efficiently in the future.
